Importowanie odpowiednich ustawień wraz z załadowaniem obrazków

```
import numpy as np
import tensorflow as tf
from tensorflow import keras
from tensorflow.keras.applications import vgg19

base_image_path = keras.utils.get_file("kaer.jpg", "https://www.purepc.pl/image/news/2018/12/14_wiedzmin_od_netfliksa_pierwsze_sceny_i_fotografie_kaer_morhen_0_b.jpg")

style_reference_image_path = keras.utils.get_file(
    "scream.jpg", "https://upload.wikimedia.org/wikipedia/commons/thumb/c/c5/Edvard_Munch%2C_1893%2C_The_Scream%2C_oil%2C_tempera_and_pastel_on_cardboard%2C_91_x_73_cm%2C_National_Gallery_of_Noi
)

result_prefix = "paris_generated"

# Weights of the different loss components
total_variation_weight = 1e-6
style_weight = 1e-6
content_weight = 2.5e-8

# Dimensions of the generated picture.
width, height = keras.preprocessing.image.load_img(base_image_path).size
img_nrows = 480
img_ncols = int(width * img_nrows / height)
```

Wyświetlenie obrazów na ekran

```
[12] from IPython.display import Image, display
    display(Image(base_image_path))
    display(Image(style_reference_image_path))
```

Tworzenie narzędzia do wstępnego przetworzenia obrazu

```
def preprocess_image(image_path):
     img = keras.preprocessing.image.load_img(
        image_path, target_size=(img_nrows, img_ncols)
    img = keras.preprocessing.image.img_to_array(img)
    img = np.expand_dims(img, axis=0)
    img = vgg19.preprocess_input(img)
    return tf.convert_to_tensor(img)
def deprocess_image(x):
    # Util function to convert a tensor into a valid image
    x = x.reshape((img_nrows, img_ncols, 3))
    x[:,:,0] += 103.939
x[:,:,1] += 116.779
    x[:, :, 2] += 123.68
    # 'BGR'->'RGB'
    x = x[:, :, ::-1]
    x = np.clip(x, 0, 255).astype("uint8")
    return x
```

Obliczanie straty transferu stylu, gdzie musimy zdefiniować 4 funkcje użytkowe:

- Gram_matrix służy do obliczania utraty stylu,
- Style_loss utrzymuje wygenerowany obraz blisko lokalnych tekstur obrazu odniesienia stylu,
- Content_loss utrzymuje wysoką reprezentację wygenerowanego obrazu zbliżoną do obrazu bazowego,
- Total_varation_loss utrata regularyzacji, która utrzymuje lokalnie spójny wygenerowany obraz.

```
[14] # The gram matrix of an image tensor (feature-wise outer product)
     def gram_matrix(x):
         x = tf.transpose(x, (2, 0, 1))
         features = tf.reshape(x, (tf.shape(x)[0], -1))
         gram = tf.matmul(features, tf.transpose(features))
         return gram
     # and from the generated image
     def style_loss(style, combination):
         S = gram_matrix(style)
         C = gram_matrix(combination)
         channels = 3
         size = img_nrows * img_ncols
         return tf.reduce_sum(tf.square(S - C)) / (4.0 * (channels ** 2) * (size ** 2))
     # base image in the generated image
     def content_loss(base, combination):
         return tf.reduce_sum(tf.square(combination - base))
     def total_variation_loss(x):
         a = tf.square(
             x[:, : img_nrows - 1, : img_ncols - 1, :] - x[:, 1:, : img_ncols - 1, :]
         b = tf.square(
             x[:, : img_nrows - 1, : img_ncols - 1, :] - x[:, : img_nrows - 1, 1:, :]
         return tf.reduce_sum(tf.pow(a + b, 1.25))
```

Tworzymy model wyodrębnienia cech, który pobiera pośrednie aktywacje VGG19

```
[15] # Build a VGG19 model loaded with pre-trained ImageNet weights
    model = vgg19.VGG19(weights="imagenet", include_top=False)

# Get the symbolic outputs of each "key" layer (we gave them unique names).
    outputs_dict = dict([(layer.name, layer.output) for layer in model.layers])

# Set up a model that returns the activation values for every layer in
    # VGG19 (as a dict).
    feature_extractor = keras.Model(inputs=model.inputs, outputs=outputs_dict)
```

Kod obliczający utratę transferu stylu

```
style_layer_names = [
    "block4_conv1",
    "block5_conv1",
content_layer_name = "block5_conv2"
def compute_loss(combination_image, base_image, style_reference_image):
    input_tensor = tf.concat(
        [base_image, style_reference_image, combination_image], axis=0
    features = feature_extractor(input_tensor)
    # Initialize the loss
   loss = tf.zeros(shape=())
    layer_features = features[content_layer_name]
    base_image_features = layer_features[0, :, :, :]
   combination_features = layer_features[2, :, :, :]
loss = loss + content_weight * content_loss(
       base_image_features, combination_features
    for layer_name in style_layer_names:
        layer_features = features[layer_name]
        style_reference_features = layer_features[1, :, :, :]
        combination_features = layer_features[2, :, :, :]
        sl = style_loss(style_reference_features, combination_features)
        loss += (style_weight / len(style_layer_names)) * sl
    loss += total_variation_weight * total_variation_loss(combination_image)
```

Dodanie dekoratora (tf.function) do obliczania strat i gradientów

```
[D] @tf.function
    def compute_loss_and_grads(combination_image, base_image, style_reference_image):
        with tf.GradientTape() as tape:
            loss = compute_loss(combination_image, base_image, style_reference_image)
        grads = tape.gradient(loss, combination_image)
        return loss, grads
```

Tworzenie pętli treningowej, ilość iteracji ustawiłem na 500, ze względu na oszczędność czasu (zgodnie ze źródłem powinno być 4000 iteracji)

Jesteśmy tutaj w stanie zmienić szybkość uczenia (decay_rate) oraz ilość korków (decay_steps)

```
[18] optimizer = keras.optimizers.SGD(
         keras.optimizers.schedules.ExponentialDecay(
             initial_learning_rate=100.0, decay_steps=100, decay_rate=0.96
     base_image = preprocess_image(base_image_path)
     style_reference_image = preprocess_image(style_reference_image_path)
     combination_image = tf.Variable(preprocess_image(base_image_path))
     iterations = 500
     for i in range(1, iterations + 1):
         loss, grads = compute_loss_and_grads(
             combination_image, base_image, style_reference_image
         optimizer.apply_gradients([(grads, combination_image)])
         if i % 100 == 0:
             print("Iteration %d: loss=%.2f" % (i, loss))
             img = deprocess_image(combination_image.numpy())
             fname = result_prefix + "_at_iteration_%d.png" % i
             keras.preprocessing.image.save_img(fname, img)
```

Uruchomienie wygenerowanego obrazu

display(Image(result_prefix + "_at_iteration_500.png"))
